## 1.0 INTRODUCTION

This 2020 Annual Groundwater Monitoring and Corrective Action Report was prepared to support compliance with the groundwater monitoring requirements of the Coal Combustion Residuals (CCR) Rule [40 CFR 257.50-107]. Specifically, this report was prepared to fulfill the requirements of 40 CFR 257.90(e). The applicable sections of the Rule are provided below in *italics*, followed by applicable information relative to the 2020 Annual Groundwater Monitoring and Corrective Action Report for the CCR Units. The Lansing Generating Station (LAN) site location is shown on **Figure 1**.

This report covers the period of groundwater monitoring from January 1, 2020, through December 31, 2020.

The groundwater monitoring system at the Lansing Generating Station (LAN) is a multiunit system that includes the following two existing CCR units:

- LAN Landfill
- LAN Upper Ash Pond

The groundwater system is designed to detect monitored constituents at the waste boundary of the facility as required by 40 CFR 257.91(d). The groundwater monitoring system currently consists of 1 upgradient monitoring well, 3 downgradient monitoring wells at the waste boundary, and 6 additional downgradient wells. Three of the additional six downgradient wells were installed as deeper delineation piezometers (**Figure 2** and **Table 1**).

## 2.0 BACKGROUND

To provide context for the annual report, the following background information is provided in this section of the report, prior to the annual report sections:

- Geologic and hydrogeologic setting
- CCR Rule monitoring system

### 2.1 GEOLOGIC AND HYDROGEOLOGIC SETTING

#### 2.1.1 Regional Information

The uppermost bedrock unit in the site area is the Jordan aquifer, which is the lower Cambrian-Ordovician sandstone interbedded with dolostone. The thickness of the Jordan aquifer varies from 50 to more than 120 feet thick in most areas of Allamakee County. Underlying the Cambrian-Ordovician sandstone are the Cambrian confining beds comprised of dolostone, siltstone, and shale. The Cambrian confining beds overlie the Dresbach Aquifer, comprised of shaly sandstone. A summary of the regional hydrogeologic stratigraphy is provided in **Appendix A**. A regional bedrock surface hydrogeologic map, hydrogeologic cross sections, and a contour map of the top of the Cambrian-Ordovician sandstone in northeastern Iowa are also included in **Appendix A**. The bedrock surface elevation is highly variable due to erosion.

The Mississippi River and associated alluvial aquifers are a major source of surface water and shallow groundwater in the area. The alluvial aquifer is up to 60 feet thick within the deeply incised valley where the Lansing Generating Station is located, but is thin to absent on the surrounding bluffs and hilltops. The lower Cambrian-Ordovician sandstone unit (Jordan sandstone) is the

shallowest regional bedrock aquifer. The October 1989 IDNR Water Atlas No. 8 states that the Jordan aquifer is commonly the source of municipal and industrial high-capacity wells in the region. A summary of the regional groundwater units is included in **Appendix A**.

A map showing the regional potentiometric surface in the Jordan sandstone is presented in **Appendix A**. This map shows the potentiometric surface near the site area as sloping to the east-northeast. The flow direction in the shallow unconsolidated aquifer at Lansing is generally to the north (**Appendix A**). The flow in the Jordan sandstone immediately beneath the landfill and ponds is also likely to the north due to the control of incoming groundwater from the bluffs flanking the valley with ultimate discharge to the Mississippi River.

### 2.1.2 Site Information

For the purposes of groundwater monitoring in accordance with section 257.91 of the CCR Rule, the shallow alluvial aquifer in combination with the hydraulically connected lower Cambrian-Ordovician sandstone unit (Jordan sandstone) is considered to be the uppermost aquifer unit at the Lansing site. The upgradient background monitoring well total boring depth was 93.5 feet. The bedrock at this location is overlain by 37 feet of unconsolidated material and the water table occurs in the bedrock.

Monitoring wells MW-301 through MW-306 and piezometers MW-302A, MW-304A, and MW306A are installed in the shallow alluvial aquifer and in the hydraulically connected lower Cambrian-Ordovician sandstone unit (Jordan sandstone), which is the uppermost aquifer unit at the Lansing site. The unconsolidated materials at these well locations are generally sand, silt, with minor clay and gravel. The total boring depths of monitoring wells MW-301 through MW-306 are between 16 and 27 feet and bedrock was not encountered in any of the monitoring well borings. The total depths of piezometers MW-302A, MW-304A, and MW-306A are between 50 and 56 feet. Bedrock was not encountered in any of the piezometer borings. Boring logs and well construction forms for all CCR monitoring wells and piezometers are included in **Appendix B**.

To evaluate groundwater flow directions and rates, groundwater flow maps were developed for two depth intervals within the aquifer. The water table maps are based on monitoring wells installed at or near the water table. The potentiometric surface maps are based on the deeper "A" wells.

The water table and potentiometric surface contours and groundwater flow patterns based on May 2020 water level measurements are shown on **Figures 3** and **4**. The water table and potentiometric surface contours and groundwater flow patterns for the October 2020 water level measurements are shown on **Figures 5** and **6**. The groundwater elevation data for the CCR monitoring wells are provided in **Table 3**, along with additional groundwater elevation data for the wells in the state monitoring program for the CCR landfill. Estimated horizontal gradients and flow velocities are provided in **Table 4A**. Calculated vertical gradients for the nested wells are provided in **Table 4B**.

## 2.2 CCR RULE MONITORING SYSTEM

The groundwater monitoring system established in accordance with the CCR Rule consists of one upgradient (background) monitoring well and three downgradient monitoring wells installed at the waste boundary (**Table 1** and **Figure 2**). The background well is MW-6 and the three downgradient compliance wells at the waste boundary include MW-301, MW-302, and MW-303. Three additional water table wells (MW-304, MW-305, and MW-306) and three deeper piezometers (MW-302A,

MW-304A, and MW-306A) were added as delineation wells to support the evaluation of the nature and extent of groundwater impacts and characterization of the site conditions.

### **3.0 § 257.90(E) ANNUAL REPORT REQUIREMENTS**

*Annual groundwater monitoring and corrective action report.* For existing CCR landfills and existing CCR surface impoundments, no later than January 31, 2018, and annually thereafter, the owner or operator must prepare an annual groundwater monitoring and corrective action report. For new CCR landfills, new CCR surface impoundments, and all lateral expansions of CCR units, the owner or operator must prepare the initial annual groundwater monitoring and corrective action report no later than January 31 of the year following the calendar year a groundwater monitoring system has been established for such CCR unit as required by this subpart, and annually thereafter. For the preceding calendar year, the annual report must document the status of the groundwater monitoring and corrective action program for the CCR unit, summarize key actions completed, describe any problems encountered, discuss actions to resolve the problems, and project key activities for the upcoming year. For purposes of this section, the owner or operator has prepared the annual report when the report is placed in the facility's operating record as required by § 257.105(h)(1). At a minimum, the annual groundwater monitoring and corrective action report must contain the following information, to the extent available:

#### **3.1 §257.90(E)(1) SITE MAP**

*A map, aerial image, or diagram showing the CCR unit and all background (or upgradient) and downgradient monitoring wells, to include the well identification numbers, that are part of the groundwater monitoring program for the CCR unit;*

A map of the site location is provided on **Figure 1**. A map with an aerial image showing the CCR units and all background (or upgradient) and downgradient monitoring wells with identification numbers for the groundwater monitoring program is provided as **Figure 2**.

#### **3.2 §257.90(E)(2) MONITORING SYSTEM CHANGES**

*Identification of any monitoring wells that were installed or decommissioned during the preceding year, along with a narrative description of why those actions were taken;*

No new monitoring wells were installed and no wells were decommissioned as part of the groundwater monitoring programs for the CCR unit in 2020.

#### **3.3 §257.90(E)(3) SUMMARY OF SAMPLING EVENTS**

*In addition to all the monitoring data obtained under §§ 257.90 through 257.98, a summary including the number of groundwater samples that were collected for analysis for each background and downgradient well, the dates the samples were collected, and whether the sample was required by the detection monitoring or assessment monitoring programs;*

Five groundwater sampling events were completed in 2020. A summary including the number of groundwater samples that were collected for analysis for each background and downgradient well, the dates the samples were collected, and whether the sample was required by the assessment monitoring programs is included in **Table 2**.

The semiannual assessment monitoring events for the entire monitoring network were completed in May and October 2020. Supplemental monitoring events performed in February, July, and August 2020 were limited to a subset of the wells and/or parameters as described below.

In February 2020, MW-306 was resampled for arsenic in response to the detection of arsenic above the GPS in one of three previous samples at this well. The supplemental arsenic result was collected to allow evaluation of whether arsenic is at a statistically significant level above the GPS at MW-306, as described in **Section 3.4**.

In July 2020, the three new piezometers (MW-302A, MW-304A, and MW-306A) were sampled for Appendix III and Appendix IV parameters. This was the second round of samples from these three wells.

In August 2020, all wells were sampled for parameters chosen to assist with the selection of remedy process. Parameters included dissolved and total metals, general water quality parameters, and parameters used to evaluate feasibility of monitored natural attenuation (MNA). Samples were also analyzed for total and dissolved molybdenum to support the evaluation of potential sources of molybdenum detected at concentrations exceeding the GPS in the initial samples from new piezometer MW-304A.

The October 2020 semiannual assessment monitoring event also included supplemental parameters to support remedy selection and evaluation of MNA. Samples were also collected from selected wells for tritium analysis as part of site characterization and to support the evaluation of potential sources of molybdenum at well MW-304A.

The 2020 monitoring results are summarized in **Table 5**. Field parameter results for the 2020 sampling events are provided in **Table 6**. The analytical reports are provided in **Appendix C**. Historical results for each monitoring well are summarized in **Appendix D**.

### **3.4 § 257.90(E)(4) MONITORING TRANSITION NARRATIVE**

*A narrative discussion of any transition between monitoring programs (e.g., the date and circumstances for transitioning from detection monitoring to assessment monitoring in addition to identifying the constituent(s) detected at a statistically significant increase over background levels);*

There was no monitoring program transition in 2020.

The LAN monitoring program transitioned to assessment monitoring beginning in April 2018 and assessment monitoring continued through 2020. An Assessment of Corrective Measures (ACM) was initiated for the LAN CCR units in April 2019 and completed in September 2019. Addendum No. 1 to the ACM was completed in November 2020. The selection of remedy is in progress. The ACM was initiated in response to the detection of arsenic at statistically significant levels exceeding the Groundwater Protection Standards (GPS). Assessment monitoring continued during the ACM and will continue during the selection of remedy.

The statistical evaluation of the October 2019 semiannual monitoring event was completed in January 2020. Evaluation of the May 2020 semiannual monitoring event and the July 2020 resampling event was completed in August 2020. Evaluation of the August 2020 supplemental monitoring event for the piezometers was completed in November 2020. Evaluation of the October 2020 semiannual monitoring event was completed in January 2021.

In 2020, Appendix IV parameters arsenic and molybdenum were detected at concentrations above the GPS values established under §257.95(h). As shown in **Table 5**, several Appendix III and Appendix IV parameters continue to be detected at levels that represent statistically significant increases (SSIs) above background. The evaluation of significance of the GPS exceedances for arsenic and molybdenum is discussed below.

In accordance with the Unified Guidance for Statistical Analysis of Groundwater Monitoring Data at RCRA Facilities (USEPA, 2009), the comparison of assessment monitoring results to the Groundwater Protection Standard (GPS) was based on the lower confidence limit (LCL) for the arithmetic mean. The LCL evaluation was completed for Appendix IV parameters that have been detected at a concentration exceeding the GPS in at least one sample result since assessment monitoring was initiated, which include arsenic and molybdenum. The LCLs were calculated with Sanitas™ using historical concentrations measured since assessment monitoring began in April 2018. The most recent LCL evaluation, completed for the October 2020 event, is provided in **Appendix E**.

Based on the LCL evaluation, the only parameter at a statistically significant level above the GPS is arsenic at compliance well MW-302, as previously identified. For delineation well MW-306, individual arsenic results have slightly exceeded the GPS, but the LCL for the mean remains below the GPS.

The LCL for the mean for molybdenum at MW-304A was only slightly below the GPS; therefore, the source of molybdenum at this well is being evaluated. As shown in the confidence interval plot in **Attachment B**, molybdenum concentrations in samples from the compliance wells located at the waste boundary of the CCR unit were well below the GPS, suggesting that the CCR unit is not the source.

A trend analysis evaluation was also completed for arsenic at the compliance and delineation wells. Trends were evaluated with Sanitas™ using historical concentrations measured since assessment monitoring began for each well. The evaluation is provided in **Appendix E**. Based on the trend analysis, there are no statistically significant trends in arsenic concentrations at the monitoring wells. For some delineation wells, additional data are needed before trends can be evaluated.

Supplemental groundwater quality parameters were included in the monitoring program in 2020 to support the selection of remedy process, including the evaluation of monitored natural attenuation (MNA). The results for the supplemental parameters are also included in **Table 5**, in the laboratory reports in **Appendix C**, and in the historical results tables in **Appendix D**.

- The groundwater elevations recorded for MW11 on 2/19/04, 11/18/04, and 5/05/05 are not considered reliable due to a minimal quantity of water observed in the well. The actual water table elevation could be lower than the reported value.
- MW3 could not be located during this sampling event.
- Repairs were completed at MW3 in July 2013. Elevations calculated for February, April, and July 2013 are estimates based on the old top of casing elevation (657.36 feet amsl). MW3 was re-surveyed on June 3, 2014.
- MW1 was repaired in April 2013. Groundwater elevations measured before this date are calculated using the old top of casing elevation (637.60 feet amsl).
- TW18 was damaged and could not be accessed for a water level measurement in April 2016. The well was repaired in July 2016.

Notes:

1: A positive vertical gradient indicates upward groundwater flow. A negative gradient indicates downward flow.

2: MW-304 and MW-306 are water table wells, and their screens were not fully submerged during the 2020 sampling events. The effective screen midpoint for a water table well is calculated for each sampling event as the midpoint between the water table elevation and the screen bottom elevation, and this value is used to calculate Distance Between Midpoints.

NM: Not Measured

See Page 3 for abbreviations and notes.

**Table 5. 2020 Groundwater Analytical Results Summary  
Lansing Generating Station / SCS Engineers Project #25220070.00**

**Abbreviations:**

UPL = Upper Prediction Limit  
 NA = Not Analyzed  
 µg/L = micrograms per liter  
 mg/L = milligrams per liter

LOD = Limit of Detection  
 LOQ = Limit of Quantitation  
 TU = Tritium Units

DQ = Double Quantification Rule (not detected in background)  
 NP = Nonparametric UPL (highest background value)  
 P = Parametric UPL with 1-of-2 retesting  
 GPS = Groundwater Protection Standard

J = Estimated concentration at or above the LOD and below the LOQ.

DQ = Double Quantification rule applies (not detected in background samples)

\* = UPL is below the LOQ for background sampling. For compliance wells, only results confirmed above the LOQ are evaluated as potential SSIs above background.

**Notes:**

1. An individual result above the UPL or GPS does not constitute a statistically significant increase (SSI) above background or statistically significant increase above the GPS. See the accompanying letter text for identification of statistically significant results.
2. GPS is the United States Environmental Protection Agency (US EPA) Maximum Contamination Level (MCL), if established; otherwise, the value from 40 CFR 257.95(h)(2) is used.
3. Interwell UPLs calculated based on results from background well MW-6.

No additional comments.

#### Receipt

The samples were received on 5/22/2020 9:50 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 2 coolers at receipt time were 1.4° C and 1.5° C.

#### RAD

Method 903.0: Radium-226 Prep Batch 160-471407

The following sample(s) did not meet the requested limit (RL) due to the low carrier recovery due to the presence of matrix interferences (see prep NCM 160-197448). The data have been reported with this narrative.

MW-304A (310-182333-8)

Method 903.0: Radium-226 Prep Batch 160-471407

Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative.

Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date.

MW-301 (310-182333-1), MW-302 (310-182333-2), MW-302A (310-182333-3), MW-304 (310-182333-4), MW-305 (310-182333-5), MW-306 (310-182333-6), MW-303 (310-182333-7), MW-304A (310-182333-8), MW-306A (310-182333-9), MW-20 (310-182333-10), MW-6 (310-182333-11), Field Blank (310-182333-12), (LCS 160-471407/1-A), (MB 160-471407/23-A), (160-38150-A-1-A) and (160-38150-B-1-A DU)

Method 904.0: Ra-228 Prep Batch 160-471408

The detection goal was not met for the following sample due to the presence of matrix interferences: MW-304A (310-182333-8). Analytical results are reported with the detection limit achieved. See Prep NCM 160-196638.

Method 904.0: Radium-228 Prep Batch 160-471408

Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative.

Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date.

MW-301 (310-182333-1), MW-302 (310-182333-2), MW-302A (310-182333-3), MW-304 (310-182333-4), MW-305 (310-182333-5), MW-306 (310-182333-6), MW-303 (310-182333-7), MW-304A (310-182333-8), MW-306A (310-182333-9), MW-20 (310-182333-10), MW-6 (310-182333-11), Field Blank (310-182333-12), (LCS 160-471408/1-A), (MB 160-471408/23-A), (160-38150-A-1-B) and (160-38150-B-1-B DU)

Method 904.0: Radium-228 Prep Batch 160-471408

The Barium carrier recovery (28.2%) is outside the lower control limit (40%) for the following sample: MW-304A (310-182333-8). There was physical evidence of matrix interference apparent during the initial preparation of the sample. The QC samples associated with the batch have acceptable carrier recovery indicating the presence of matrix interference. See Prep NCM 160-196638.

Method PrecSep\_0: Radium 228 Prep Batch 160-471408:

Sample 310-182333-8 was reduced due to orange discoloration and a cloudy appearance. Samples 680-184046-3 and 5 were reduced

Method PrecSep\_0: Radium 226 Prep Batch 471407:

The Ba carrier recovery is outside the lower control limit (40%) for the following sample: MW-304A (310-182333-8). The sample produced a small pellet during the barium sulfate precipitation. The sample was also prepared at a reduced aliquot, potentially resulting in the low carrier recovery.

Method 904.0: 904 Prep batch 160-487322 Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative. Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date. Method PrecSep\_0: Radium 228 Prep Batch 160-487322: Samples 310-193626-10 and 310-193674-2 were prepared at a reduced aliquot due to yellow discoloration: Sample 310-193674-8 was prepared at a reduced aliquot due to a cloudy appearance:

Method PrecSep\_0: Radium 228 Prep Batch 160-487322: The following samples were prepared at a reduced aliquot to insure sufficient volume remains if needed for analysis: FIELD BLANK (310-193674-12).

Method PrecSep\_0: Radium 228 Prep Batch 160-487322: Insufficient sample volume was available to perform a sample duplicate for the following samples: MW-301 (310-193674-1), MW-302 (310-193674-2), MW-303 (310-193674-3), MW-304 (310-193674-4), MW-305 (310-193674-5), MW-306 (310-193674-6), MW-302A (310-193674-7), MW-304A (310-193674-8), MW-306A (310-193674-9), MW-20 (310-193674-10), MW-6 (310-193674-11) and FIELD BLANK (310-193674-12). A laboratory control sample/ laboratory control sample duplicate (LCS/LCSD) were prepared instead to demonstrate batch precision.

Method PrecSep\_0: Radium 228 Prep Batch 160-487322: The following sample was double spiked with Ba Carrier\_00080: MW-6 (310-193674-11).

Method PrecSep\_0: Radium 228 prep batch 160-487322 The Barium carrier recovery is outside the upper control limit (110%) for the following sample: MW-6 (310-193674-11). This sample was spiked twice with barium carrier and that is why the recovery is so high.

## Qualifiers

### Metals

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
